

INTERNAL TECHNOLOGY DEVELOPMENT MEMO • 5-YEAR HORIZON

Centerbridge | Overland Deal Lifecycle Automation

This memo presents the findings of a current-state diagnostic across Overland's full deal lifecycle — origination through asset management — and makes the case for a phase-ordered automation suite. It maps identified opportunities against the six deal stages, quantifies ROI across three independent levers, and demonstrates that the buildout self-funds from year one.

HORIZON
2026 — 2030

AUDIENCE
CBP & Overland Senior Leadership

Executive Summary

Where the diagnostic landed and what the next phase is being asked to scope.

Current-state diagnostic is complete; the next phase scopes operations, AM, and applied AI tooling.

01 · COMPLETED

What's been done

- ✓ **End-to-end deal lifecycle documented.** All 19 phases from origination through portfolio monitoring mapped, including inputs, outputs, participants, systems, and pain points.
- ✓ **Cross-functional coverage.** Sessions with underwriting (Jamie, Nico) and asset management (Lauren) captured the full handoff through Chronograph and monitoring.
- ✓ **Template library inventoried.** Intake, memo, diligence, model, and legal materials catalogued and organized.
- ✓ **Systems and technology gaps documented.** Tools across each phase (DealCloud, Chronograph, Excel, SharePoint) inventoried alongside gaps and pain points.
- ✓ **Process map and visual deliverable produced.** Formal current-state process map (PDF and Word) capturing the full deal flow with systems, stakeholders, gaps, and pain points.

02 · REMAINING

What remains

- **Operations & Asset Management process mapping.** Scope post-close monitoring, Chronograph gaps, compliance certs, and valuation across Paige (DealCloud/SF), Lauren's team, Ryan Hunt's team (fund finance, closing, RC & DDTL draws), Legal & Compliance, and Marketing & IR.
- **AM, operations, and IR pain-point discovery.** Uncover and document bottlenecks, opportunities, and potential solutions across back- and middle-office.
- **Current applied AI tooling review.** Inventory prompts, skills, and artifacts already drafted; identify what can be improved and standardized.
- **Technology and market-data review.** Assess PitchBook, CapIQ, Claude, AlphaSense, AlphaSights, GLG, BamSEC, DealCloud, Salesforce Financial Services Cloud, Microsoft Dynamics CRM, Ironclad, DocuSign CLM, Harvey AI, Ansarada, Asana, Oracle Crystal Ball, Quantrix, Alteryx, Tableau, Microsoft Power BI, Zeck, SyndTrak, Debt Domain, Allvue, Wall Street Office (WSO), Chronograph, 73 Strings, Snowflake, MuleSoft, and Boomi.
- **Custom build requirements & ROI validation.** Translate process gaps and tooling whitespace into a scoped application backlog over the shared Snowflake substrate; pressure-test the P1 lead-enablement use case and stress the Growth Gap and Efficiency Dividend economics before committing capex.

Deal Lifecycle at a Glance

Overland's credit process is an end-to-end workflow spanning 19 phases — moving each opportunity through five visible stages from sourcing and screening, through term sheet and commitment, into closing and active portfolio management.

01	P1–P4	02	P5–P8	03	P9–P12	04	P13–P16	05	P17–P19
Origination & Screening		Term Sheet		Commitment		Closing		Asset Management	
SOURCING, NDA, KICK-OFF & POSTING		INITIAL DD, PRE-SCREEN IC, TERM SHEET		FOLLOW-UP DD, IC, EL / DCPS		SYNDICATION, DOCUMENTATION, FUNDING		MONITORING, REPORTING, AMENDMENTS	
- Sourcing via WFSC RMs, sponsors, and external IBs (P1) - NDA processing via Ontra; deal entered into DealCloud (P2) - Kick-Off DDQ issued; CIM and other materials received (P3) - Posting Memo drafted with stoplight risk rating (P4)		- Initial DDQ issued and reviewed (P5) - Initial DD: databook, model, expert calls (P6) - Pre-Screen IC Memo prepared and reviewed (P7) - Term Sheet issued to borrower (P8)		- Follow-Up DDQ based on IC pre-screen feedback (P9) - Follow-Up DD; final IC Commitment Memo prepared (P10) - Commitment IC: formal investment committee approval (P11) - Exclusivity Letter / Commitment Papers (optional) (P12)		- Co-Lender / GP syndication coordinated (P13) - Credit Agreement negotiated and executed (P14) - KYC, funds flow, and closing & funding completed (P15) - Closing Memo distributed to AM and finance teams (P16)		- Quarterly compliance certificates reviewed in Chronograph (P17) - Valuations and marks maintained for NAV / LP reporting (P18) - Amendments and watchlist management as needed (P19) - Workout and exit coordination by CBP Asset Mgmt	

DEAL FLOW

~4% lead-to-close

~945–1.22k deals screened / year by EoY 2030 to meet target Cos / AUM goals

CRITERIA

\$25M+ EBITDA

\$250–300MM facility + \$20–50MM+ RCF · Non-sponsored, cash flow-oriented

CO-LENDERS

1–6+ LPs & select GPs

BCI, Liberty Mutual, NY Life, National Life, Hamilton Lane, StepStone

Identified Pain Points

Friction concentrates in posting, IC, and asset management — most pain points trace to manual workflows, system-of-record gaps, and dual-entry across DealCloud, Confi Manager, and Chronograph.

EXECUTIVE SUMMARY	SCREENING	TERM SHEET	COMMITMENT	CLOSING	ASSET MGMT
P1 to P2 SOURCING & NDA	P3 to P4 KICK-OFF & POSTING	P5 to P8 INITIAL DD & TERM SHEET	P9 to P12 FOLLOW-UP DD & COMMITMENT	P13 to P16 SYNDICATION & DOCUMENTATION	P17 to P19 MONITORING & AMENDENDMENTS

VDRs (Datasite, Intralinks, Debtdomain)	TOOLING - Chronograph - Excel (mark to market) - SharePoint - DealCloud - Outlook (AM dist list)

PAIN POINTS · 4

- Sales Force to DealCloud is nightly batch only — creates lag; email leads, system trails
- All inbound screening is manual; no auto teaser parse / enrichment at intake
- Wells Fargo RM learning curve creates inconsistent lending and process challenges
- DealCloud and Confi Manager require dual entry on overlapping fields

PAIN POINTS · 3

- Posting memo credit process consumes significant time with high rejection rate
- No IC posting meeting minutes; summary built post hoc from memory
- No central searchable repository for CIMs, QoEs, expert transcripts across CB

PAIN POINTS · 4

- No DDQ item lifecycle tracker; status across iterations is ad hoc
- Informal IC reapprovals via email when terms move beyond approved bandwidth
- Term negotiation tracked ad hoc; no structured redline or version history
- IC summary slide created post meeting and ad hoc from memory; no real time capture

PAIN POINTS · 4

- No IC vote / approval system of record
- No documentation for conditional leverage approvals with bandwidth
- No automated extract of final terms from executed credit agreement
- No deal closing diligence platform; redline tracking is fully manual

PAIN POINTS · 4

- Commitment book tracked in ad hoc Excel; no syndication mgmt system
- WF inexperience with DDTL / direct lending pushes admin burden onto OL
- No closing checklist tracking; KYC repository fully manual
- Inconsistent UW to AM handoff at close; databook may not reach Chronograph

PAIN POINTS · 4

- Chronograph not fully utilized as source of truth; monitoring features not leveraged
- Manual Excel mark to market valuations
- Compliance certs frequently contain CFO arithmetic errors; OL catches manually
- DDTL draws approved over email; no compliance verification tracked

Identified Opportunities

AI and automation can compress every stage — from teaser parsing and DDQ generation at intake, through IC memo auto-build, to syndication CRM and Chronograph auto-feed in asset management.

The Growth Gap — Status Quo vs. Growth Target

Year-by-year trajectory at current pace (16 closes/yr) vs. growth plan needed to reach 225 portfolio companies by YE 2030

PORTFOLIO GAP

115 names

110 (SQ) vs. 225 (target)

AUM SHORTFALL

\$8.6B

\$8.3B (SQ) vs. \$16.9B (target)

REVENUE GAP

\$125M / yr

\$120M (SQ) vs. \$245M (target)

Deal lifecycle optimizations reduce cost-per-close — but without WF lead-enablement (P1) to accelerate sourcing, Overland stays on the gray line: 115 fewer names, \$8.6B less AUM, and \$125M less fee revenue at 2030 run-rate.

The Efficiency Dividend — No Automation vs. Automation-Enabled

Same growth target (225 portfolio companies by YE 2030) — automation changes what it costs to get there

HEADCOUNT SAVINGS

~75 IPs

120 (No Auto) vs. 45 (Auto) at 5.0x cos/IP

IP COST SAVINGS

\$44.8M / yr

\$71.8M (No Auto) vs. \$27M (Auto) at 2030 run-rate

NET TECH ROI

\$42.8M / yr

\$44.8M IP savings – \$2M tech cost; \$119.9M cumulative over 5 yrs

Automation doesn't change what Overland needs to achieve — it changes what it costs to get there, lifting cos/IP from 1.88x (peer avg) to 5.0x and saving ~75 IPs at scale. At \$10M cumulative tech investment over 5 years, the net ROI is \$119.9M — a 12x return.

Foundation Controls: Governance Investments Required at Any Scale

Required at any portfolio size — 30 names, 110, or 225 — these are operating standards for an institutionally managed direct lending GP, with material upside as portable Centerbridge platform infrastructure

Conflicts & Cross-Strategy Allocation

Treasury allocation across Overland fund entities — hold size, investment criteria, concentration limits, and economic targets differ by SMA and fund — and across non-Overland Credit, PE, and RE pockets; the logic must be systematic, defensible, and auditable.

IC Approvals & Approval Tracking

No formal IC vote tracking today, conditional approvals undocumented, no system gate between IC approval and fund release — audit and regulatory exposure that compounds as the book scales.

Pricing, Fee Grids & Call Protection

Are we being paid correctly — pro rata P&I on time, pricing and unused-fee grids applied per the credit agreement, and call protection collected whenever it is active and a prepayment triggers it.

RCF & DDTL Draws

Draws are conditional — no default or EoD, pro forma leverage within covenant, and permitted use of proceeds. Those conditions must be enforced at funding so we never wire to a Company that technically isn't entitled to the money.

Compliance Certs, Leverage & ECF

Are the Company's certs accurate — leverage and ECF calculations tied to the credit agreement's specific definitions, sweeps applied at the right level, and ECF allocated pro rata across tranches when owed.

Valuation / Mark-to-Market

Portfolio marking cadence, methodology, and defensibility are under increasing SEC scrutiny; Apollo's commitment to daily NAV marks signals where fair-value expectations for private credit are headed.

PortCo Reimbursement of OOP Expenses

Systematized tracking and invoicing of rechargeable expenses (legal, diligence, monitoring) is a fiduciary obligation — not an operational convenience.

LP Reporting — Current & Prospective / SMA

Prospective LPs and SMAs increasingly want company- and loan-level transparency — waiver, consent, and amendment counts across the book; technical vs. material classification; and drivers (performance, liquidity, post-close clean-up) on demand.

ONE-TEAM · A CORE VALUE, NOT YET A TECHNOLOGICAL REALITY

One Team is a core CB value, but it is not yet a technological reality — the data across our strategies does not talk to itself. When an IP in any strategy isn't sought out, forgets a detail, or leaves the platform, their insights leave with them. Build the controls above on a common architecture and the knowledge base does not just persist — it grows, compounds across Credit, PE, and RE, and accrues to every future deal team.

These controls are not contingent on hitting 225 names — they are the operating standard for an institutionally managed direct lending GP, and the platform that delivers them is portable across Centerbridge. Several gaps (IC approval tracking, valuation, compliance certs) are audit and regulatory exposures today per Section V — automating them reduces error risk and incremental compliance cost as the portfolio scales, but the obligation exists independent of growth path.

Three paths to close the gap — only one delivers One Team.

Two alternatives move a number. One moves the operating model.

ALTERNATIVES CONSIDERED

OPTION A

Extend the Status Quo

WHY

Near-zero capex; immediate IP-level productivity from a growing Claude library. Useful regardless of the path chosen.

WHY NOT

Artifacts live in individual users' contexts — nothing accrues to the firm, nothing compounds across deals, and the foundation controls stay open.

OPTION B

Buy Commercial Point Solutions

WHY

Fastest parity on commodity workflows — CLM, data rooms, loan accounting, syndication — through established vendors.

WHY NOT

Built for sponsor-backed BSL, not US-MM non-sponsored. Each vendor has its own data model, so the stack does not talk to itself; and no product closes the P1 gap that drives the Growth Gap revenue.

RECOMMENDATION · OPTION C

Build a custom application suite over a shared substrate.

A semi-autonomous, agentically orchestrated mesh of purpose-built FastAPI applications on top of CBP's existing Snowflake DB. Every node carries its own data model and is a peer on the mesh.

MAKES ONE TEAM REAL

Turns a core value into a platform property — knowledge persists past any individual IP and compounds across Credit, PE, and RE.

CLOSES THE GROWTH GAP

Solves the P1 lead-enablement layer no vendor can supply — putting +\$285M of cumulative fee revenue (2026–30), +\$8.6B of YE2030 funded AUM, and +115 portfolio companies on the table vs. the Status Quo.

CAPTURES THE EFFICIENCY DIVIDEND

Tempers the IP-headcount growth that scaling from 30 names today (8 underwriters, a lean AM team) to 110 or 225+ would otherwise force — ~75 IPs avoided and ~\$120M of net cumulative cost savings vs. running the same book without automation.

PRESERVES OPTIONALITY

Institutionalizes the Option A library that is otherwise being built ad-hoc, without firm-level coordination or QA. No vendor lock — unplug a tool, plug in another, or build onto the existing node. Buy-vs-build stays open at every application; Option C's architecture is simply the most flexible substrate for whichever way that call lands, today or down the road.

Pursue Option C as the primary path; keep Option A in parallel as a no-regret bridge. Re-evaluate Option B opportunistically, application by application, once the substrate exists — only Option C simultaneously closes the Growth Gap, captures the Efficiency Dividend, and makes One Team a property of the technology rather than a value statement.

The Business Case

Three independent ROI levers stack to a buildout that self-funds from year one.

The buildout pencils on three independent ROI levers — and self-funds from year one of the phased rollout.

LEVER 01 • FEE ACCRETION

\$285_{M cumulative}

5-yr fee delta vs. Status Quo (110 PCs by YE'30); Automation-Base scales to 225 PCs and \$245M run-rate fees vs. \$120M.

LEVER 02 • HEAD COUNT AVOIDANCE

\$42.8_{M/yr}

2030 run-rate savings vs. peer-regression baseline (1.88×). Sensitivity band \$25–49M at base \$600K/IP; up to \$54M at \$750K/IP.

LEVER 03 • CBP DATA UNIFICATION

~\$46_{BAUM}

Strategy-agnostic data substrate amortized across ~\$46B AUM (CB Credit, PE, RE) — spreads buildout cost and unlocks one-team workflows.

CUMULATIVE BUILDOUT • 2026 – 2030

\$7.5 – 12.5M_{total (\$10M base)}

\$1.5–2.5M/yr at run-rate; 3.5–4.5 incremental FTE on top of existing 5-person CB dev team.

PAYBACK ON FULL BUILDOUT

Self-funds_{from Year One}

\$10M cumulative spend recovered in ~3 months at 2030 run-rate; annual benefit (\$8M → \$43M) exceeds spend in every year.

Load-bearing assumption. Multiagent engineering throughput drives the \$1.5–2.5M/yr cost frame; if it does not materialize, run-rate reverts toward \$3–6M/yr and firm-wide amortization carries proportionally more weight.

Across four scenarios, automation at base case delivers \$42.8M/yr vs holding the line without automation, and \$76.9M/yr vs status quo at today's scale. Upside case extends to \$83.1M/yr.

2030 run-rate · \$M unless noted · vs. Status Quo baseline (110 cos today) for Δ framing

METRIC	UNIT	STATUS QUO · 110 COS	NO AUTOMATION · 225 COS	AUTO · BASE · 225 COS	AUTO · UPSIDE · 225 COS
Portfolio companies	#	110	225	225	225
Cumulative funded AUM	\$B	8.3	16.9	16.9	16.9
NAV	\$B	3.9	8.0	8.0	8.0
IPs required for 2030 target ¹	#	29	120	45	35
Total fee revenue	\$M/yr	84.4	172.7	172.7	172.7
IP cost (fully loaded)	\$M/yr	17.6	71.8	27.0	20.8
Tech opex / capex	\$M/yr	—	—	2.0	2.0
Total cost (IP + tech)	\$M/yr	17.6	71.8	29.0	22.8
Net annual benefit vs. Status Quo	\$M/yr	—	\$34.1M	\$76.9M	\$83.1M
Net benefit vs. No Automation (pure tech ROI)	\$M/yr	—	—	\$42.8M	\$49.0M

STATUS QUO (110 COS)

\$34.1M / yr cost of standing still vs. growing without automation

AUTOMATION · BASE (5.0× COS/IP)

\$42.8M / yr saved vs. no-automation; \$76.9M vs. status quo

AUTOMATION · UPSIDE (6.5× COS/IP)

\$49.0M / yr vs. no-automation; \$83.1M vs. status quo

Assumption Status Quo holds today's 110 cos / 8 IPs scale; No Automation grows to 225 cos at 1.88× cos/IP peer benchmark (120 IPs). Automation cases grow to 225 cos at 5.0× (Base) and 6.5× (Upside) cos/IP. \$600K/IP fully loaded; \$2.0M/yr tech run-rate.

Note Δ vs. Status Quo bundles growth AND tech-cost benefit (per prompt anchor). Δ vs. No Automation isolates pure technology ROI holding scale constant at 225 names. ¹Δ IPs vs. Status Quo crosses portfolio-size assumptions (225 vs. 110 names). The operational savings lever is vs. No Automation: 120 IPs → 45 IPs (−75 IPs; −\$44.8M/yr at \$600K/IP fully loaded). Source: ROI Model v1, Summary tab.

The Diversification Gap

Closing the 200–250-name gap converts portfolio scale into \$285M cumulative fee delta and a \$245M run-rate by 2030.

15 · THE GROWTH GAP · OVERLAND NEEDS 200–250 NAMES TO REACH BDC SCALE

Overland needs 200–250 portfolio companies to match leading BDC diversification — at today's pace, it won't get there.

TODAY · MID-2026

~30

Portfolio companies · 8 IPs · \$2.55B funded AUM · 16 closes TTM (4/qtr) · 4% lead-to-close, in line with peer BDCs.

DIVERSIFICATION TARGET

200 – 250

Portfolio companies by YE 2030 — diversification consistent with leading BDC peers.

THE BINDING CONSTRAINT

Supply, not conversion.

Conversion is already at peer benchmark (4% lead-to-close). Reaching 200–250 names at today's 16 closes/yr requires ~3–4× lift in qualified lead volume by 2030 — and WF channel exclusivity for non-sponsored flow is the strategic moat to surface it.

P1 is the lever. Proprietary screens on NAICS Association, Pitchbook, Preqin, and CapIQ help WF mine non-sponsored flow from its relationship network — a step-change in lead enhancement, not a parallel lead-generation function.

Lead-enhancement automation potentially unlocks +115 closes, +\$8.6B AUM, +\$4.1B NAV and +\$285M cumulative fees vs. Status Quo through 2030.

2030 SCENARIO COMPARISON • STATUS QUO VS. AUTOMATION-BASE

2030 RUN-RATE	STATUS QUO		AUTO-BASE	Δ VS SQ
Portfolio Cos	110		225	+115
Cum AUM (\$M)	8,250		16,875	+8,625
Total Fees (\$M)	119.8		245.0	+125.2

WHY THIS IS A LEVER, NOT A COST

Δ vs. Status Quo: 225 PCs vs. 110 PCs by YE'30

5-yr cum fee revenue: \$710M vs. \$425M (+\$285M)

2030 run-rate Overland fees: \$245M vs. \$120M (+\$125M/yr)

YEAR-BY-YEAR Δ VS. STATUS QUO • CLOSURES, AUM, NAV & FEES

YEAR	Δ CLOSURES	Δ AUM (\$M)	Δ NAV (\$M)	Δ FEES (\$M)
2026	+2	+150	+71	+2.2
2027	+14	+1,050	+500	+17.4
2028	+29	+2,175	+1,035	+49.0
2029	+39	+2,925	+1,392	+91.5
2030	+31	+2,325	+1,107	+125.2
5-YR / '30	+115	+8,625	+4,106	+\$285.3

Mechanism The +\$285M cumulative / +\$125M run-rate fee delta flows from the closes ramp (16 → 47/yr) that P1 lead enhancement makes throughput-feasible (see slide 10). Without the ramp, portfolio holds at ~110 PCs and fees track Status Quo.

Assumption The ramp embeds a +2.44× lift over today's 4% lead-to-close baseline. P1 ships H2 '26; uplift is currently unmeasured — re-mark after 6 months of production data.

The Workflow Evidence

Non-sponsor labor intensity exposes a \$42.8M / yr run-rate savings vs. the 1.88× peer baseline by 2030.

Non-sponsor deals embed materially more labor per dollar of AUM at every stage of the lifecycle.

STAGE	FRICTION SOURCE	LOW	BASE	HIGH
Sourcing	WF RMs surface a wider distribution of candidates than sponsor-funneled flow; 60–80% of WF leads die in initial screen vs. 40–60% sponsor.	+30%	+40%	+50%
Underwriting	Data room reconstruction, GAAP normalization, addback substantiation against unaudited financials, deeper management ODD, legal cleanup. 200–400+ hours vs. 150–250 sponsor.	+30%	+60%	+90%
IC preparation	No sponsor CIM. Credit narrative built from raw inputs. Structural reformatting and consistency checks consume IC-prep hours.	+30%	+50%	+70%
Syndication	Overland syndicates a meaningful portion of each deal to existing LPs, prospective LPs, and selected GPs — marketing, allocation, and investor Q&A all run through the underwriting deal team. Larger DL platforms (Antares, Golub, Blue Owl) carry dedicated capital-markets desks staffed with capital-markets IPs who absorb this workstream off the deal team's plate.	+40%	+60%	+80%
Portfolio monitoring	Variable reporting maturity; family/founder management requires hand-holding. 1.6 covenants/deal means relationship-based monitoring, not triggered diligence. ~30–60 extra hours / name / year.	+40%	+70%	+100%

Translation: peer ratios are not portable. The 13-manager **peer-average is 1.88× cos/IP** ; the friction premiums above — including a syndication workstream that larger DL platforms offload to dedicated capital-markets desks — mean an Overland IP carries **~50–70% more work per name** than the average peer IP. Absent automation, Overland's natural ratio lands closer to **~1.1–1.3×** , materially below the peer mean — driving the 2030 IP requirement on the next slide.

Assumption Per-stage premiums are estimated against sponsor-led comparables; sourcing premium derives from observed lead-to-close conversion (4% TTM) and inferred screen failure rates.

Implication Peer cos/IP ratios are not directly portable to a non-sponsor book without a structural production-function shift.

Non-sponsor workload is heavier, yet Overland already runs Cos/IP at ~2× the peer mean.

#	GP / MANAGER	BDC VEHICLES	BDC NAV (\$B)	DLAUM (\$B)	AVG COS	DL IPS	DLAUM / IP (\$M)	COS / IP
1	Morgan Stanley	MSDL	\$1.69	\$20	227	44	\$454.5	5.16×
2	Overland (current)	Overland Advantage	2.55	2.55	30	8	318.8	3.75×
3	Blue Owl Capital	OBDC, OCIC, OTF, OBDC II, OTIC	33.3	115	429	130	884.6	3.30×

10	Ares Management	ARCC, ASIF	15.7	190	722	560	339.3	1.29×
11	Churchill / Nuveen	NCDL	0.86	50	236	200	250.0	1.18×
12	Blackstone (BXCI)	BCRED, BXSL	51.1	230	508	439	523.9	1.16×
13	Goldman Sachs	GSBD	1.37	30	173	210	142.9	0.82×
14	Apollo Global	ADS, MFIC	18.1	238	326	519	458.6	0.63×
15	Sixth Street	TSLX	1.54	40	143	300	133.3	0.48×
16	Carlyle Group	CGBD	1.33	15	165	N/D	—	—

Without automation, Overland regresses toward the peer-average 1.88×, and the IP requirement compounds from there.

IPS REQUIRED AT 2030 PORTFOLIO TARGETS

SCENARIO	COS/IP	IPs @ 225	IP Costs
Peer average (regression anchor)	1.88	120	\$71.8M
Overland today (no automation)	3.75	60	\$36.0M
Automation-assisted (base)	5.0	45	\$27.0M
Automation-assisted (optimistic)	6.5	35	\$20.8M

Regression anchor 1.88× is the GP-weighted mean Cos/IP across the 13 BDC managers benchmarked on slide 04 (excluding Overland and Carlyle, where IP count was not disclosed). It absorbs the full spread of the peer set and is the most defensible baseline for where a non-sponsor book settles at scale absent a structural production-function shift.

IMPLIED RUN-RATE 2030 HC COSTS • \$600K / IP FULLY LOADED

SCENARIO	IPS	\$M / YR
Peer-average regression	106–133	\$64–80
Overland current ratio held	53–67	\$32–40
Automation base	40–50	\$24–30
Automation optimistic	31–38	\$19–23

Anchor to the average, not the outliers. Holding 3.75× through 2030 defies peer gravity as the book matures from 30 to 200+ names. Unautomated steady state regresses toward **1.88×** — implying **~120 IPs** and **\$71.8M/yr**.

CBP leadership framing Defensible savings range \$43–49M/yr • midpoint ~\$46M vs. no automation (Automation-Base to Automation-Optimistic at \$600K/IP).

The Build Plan

A shared platform amortized across ~\$46B AUM — 13 domain apps on one substrate spanning Credit, PE, and RE.

A platform layer amortized firm-wide across ~\$46B AUM, plus 13 domain apps spanning intake through amendments.

PLATFORM / DATA SUBSTRATE

Strategy-agnostic; serves CB Credit, PE, RE. Amortized against ~\$46B firm-wide AUM.

Master data API · golden records
Document registry · firm-wide
LLM service · Claude API brokering
Snowflake medallion ·
Bronze/Silver/Gold

WHY THIS WORKS

Workflow specificity to non-sponsored DL · firm-owned data substrate · vendor independence · revenue acceleration via A1 first.

HEADCOUNT

Existing 5-person CB dev team contributes ~1.5–2 FTE · 2–3 engineers + 1 product + 0.5 data net new = 3.5–4.5 incremental FTE.

OPERATING ECONOMICS

0.3 – 0.8%

Each domain app closes a workflow gap that commercial tooling leaves open.

#	APP NAME	APP FUNCTION	REAL-WORLD EQUIVALENTS	PRIMARY GAP CLOSED
A1	Pipeline Intelligence	Deal origination & pipeline; golden-source deal record	Custom-built — no direct equivalent	Only canonical deal record that propagates across a connected suite as the golden-source MDM entity
A2	NDA Workflow	NDA workflow; post-signature obligation tracking	Ironclad · DocuSign CLM	Natively gates downstream deal access on NDA execution — no commercial CLM does this inside a connected platform
A3	Deal CRM	Deal CRM, ethical walls, relationship intelligence	DealCloud · Salesforce FSC · MS Dynamics CRM	Enforces ethical walls across the deal suite and propagates relationships into live downstream workflows
A4	Diligence Workflow	Diligence workflow, QA tracking, similar-question retrieval	Ansarada · Asana	Seeds DD queue from a structured triage memo and links findings back into model and IC memo in a unified layer
A5	Fin Modeling	Financial modeling, scenario & Monte Carlo, version control	Crystal Ball · Quantrix · Alteryx · Tableau · Power BI	Maintains audit lineage from document receipt through model output; auto-refreshes inputs from agreed terms and DD findings
A6	Memo Drafting	Credit memo drafting with LLM-assisted authoring	Custom-built — no direct equivalent	Memo seeded by DD findings, model outputs, and agreed terms from upstream deal data — not drafted in isolation
A7	IC Deliberation	IC deliberation: sealed pre-vote, append-only decision log	Zeck	Writes IC decisions to an immutable audit trail that propagates approved terms to downstream execution apps
A8	Term Sheet & Legal Docs	Term sheet & legal doc drafting; precedent library; clause comparison	Harvey AI · Ironclad	Auto-populates term sheets from IC-approved economics and selects precedent clauses driven by live deal context
A9	Syndication	Syndication, agency, co-lender DD & borrower portal	Debt Domain · SyndTrak	Combines joint book-running controls, AI-assisted co-lender DD, and a post-close borrower portal in one workspace
A10	Closing	Closing checklist, KYC/AML gating, two-phase funding handoff	Allvue (closing module)	Hardened idempotent two-phase funding handoff — activates loan ledger only after wire and compliance clearance
A11	Loan Admin	Loan administration, payments, amendments, loan ledger	WSO · Allvue Investment Accounting	Integrates directly with upstream deal data — eliminates manual reconciliation and re-keying from negotiation systems
A12	Port Monitoring	Portfolio monitoring: covenants, early-warning risk scores	Chronograph · 73 Strings Monitor/Extract	Receives loan events in real time from the firm's own loan admin; full covenant, financial, and deal context in one layer
A13	Valuation	Valuation: stage-gate fair value, roll-forward, IPEV/ASC 820	Chronograph Valuations · 73 Strings 73 Value	First-class consumer of a unified portfolio data product — direct lineage from loan admin back to original deal

Every domain app exists because a commercial gap exists — not because we want to rebuild what vendors already do well. Each row is a workflow no off-the-shelf tool closes inside a connected private-credit suite.

24 · DELIVERY SCHEDULE · A1 SHIPS FIRST · PLATFORM COMPLETE BY 2030

Build chronologically: each app feeds the next, and shipping the deal lifecycle in order earns buy-in from one domain team at a time.
